PROBLEM

	Agent close to database	
Agent for human-computer interaction	Agent for communication between other software systems	Agent for error handlings
	Agent close to User	
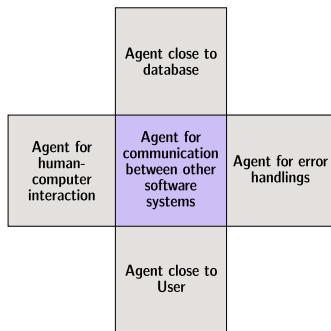

There are three main Problems based on that:

- Agents often maintain their own state and data

- Interactive agents provide their own user interface

- Systems evolve over time

Resonbility

- coordinate lower-level PAC agents
- Composes lower-level PAC agents to a single unit of higher abstractation
